---

All:

The attached is the Pesticide and PCB results for the soil samples taken in the residential area of impacted soils and some of the ditches. A quick review only showed some chlorodane hits which are unrelated. We are still waiting on the herbicide results. I think we really have what we need and the herbicides will likely be minimal or nonexistent as well. At this point, I have not really seen anything that gives me any concern about the soils but I need to get all the data and get them in a good table with the various comparison data to be sure.

If you have any questions, please let me know.

Thanks
